

# Comparative Life Cycle Assessment of Tetra Pak carton packages and competing packaging systems for packaging of vegetable oil on the French market

Extended summary , August 2017

Frank Wellenreuther, Mirjam Busch, Stefanie Markwardt, Samuel Schlecht

# Content

---

-  Goal and Scope of LCA 2017 for vegetable oil
-  Packaging Specifications
-  First results of LCA 2017 for vegetable oil, 1000 mL

# Goal of the study

---

## The objectives of the current study are

- To provide an up-to date knowledge of the environmental strengths and weaknesses of Tetra Pak's carton systems for the packaging of JNSD and UHT milk under French market conditions
- To compare the environmental performance of the carton packs with those of competing packaging systems (i.e. PET bottle, glass bottle and aluminium can)

## Organisation of the study

- This study was commissioned by Tetra Pak in 2016. It is being conducted by the Institute for Energy and Environmental Research Heidelberg GmbH (ifeu)

## Use of the study

- This study is performed **based on the ISO framework on LCA (ISO 14040 and ISO 14044)**. However, an explicit proof of ISO conformity of this study has not been pursued as the intended application of the present study is support of company-internal decision-making and internal communication

## Critical review

The LCA study is performed **according to the ISO standard on LCA (ISO 14040 and ISO 14044)**. As the results of this study shall be used for internal and external communication, the study has been critically reviewed according to ISO 14040/14044.

The review panel consisted of the following three independent members:

- Håkan Stripple, IVL Swedish Environmental Research Institute Ltd., Sweden, (Chairman)
- Prof. Dr. Birgit Grahl, INTEGRAHL Germany
- Alessandra Zamagni, Ecoinnovazione, Italy

### *Review Statement*

The undersigned reviewers confirm that the reviewed study “Comparative Life Cycle Assessment of Tetra Pak® carton packages and competing packaging systems for the packaging of wine and vegetable oil on the French market” has been conducted according to and in compliance with the ISO standards 14040 and 14044 and has relevant data sources. The results from the study are in compliance with the steering documents identified under the abovementioned scope of this review.

## Selection of packaging systems

The choice of beverage cartons and alternative packages examined in this study has been made by Tetra Pak based on market research.

# Scope of the study

---

## Functional unit

The function examined in this LCA study is the packaging of beverages for retail. The functional unit for this study is the provision of 1000 L beverage at the point of sale in France.

## Geographic scope

- The LCA study focuses on the production, distribution and disposal of beverage packages sold and used in France
- For a certain share of the raw materials, country-specific data is used as well as European averages depending on the availability.
- The location of sleeve/laminated carton production for the beverage cartons has been considered in the model (e.g. production site in Serbia)
- The location of filling in Spain for oil has been considered in the model

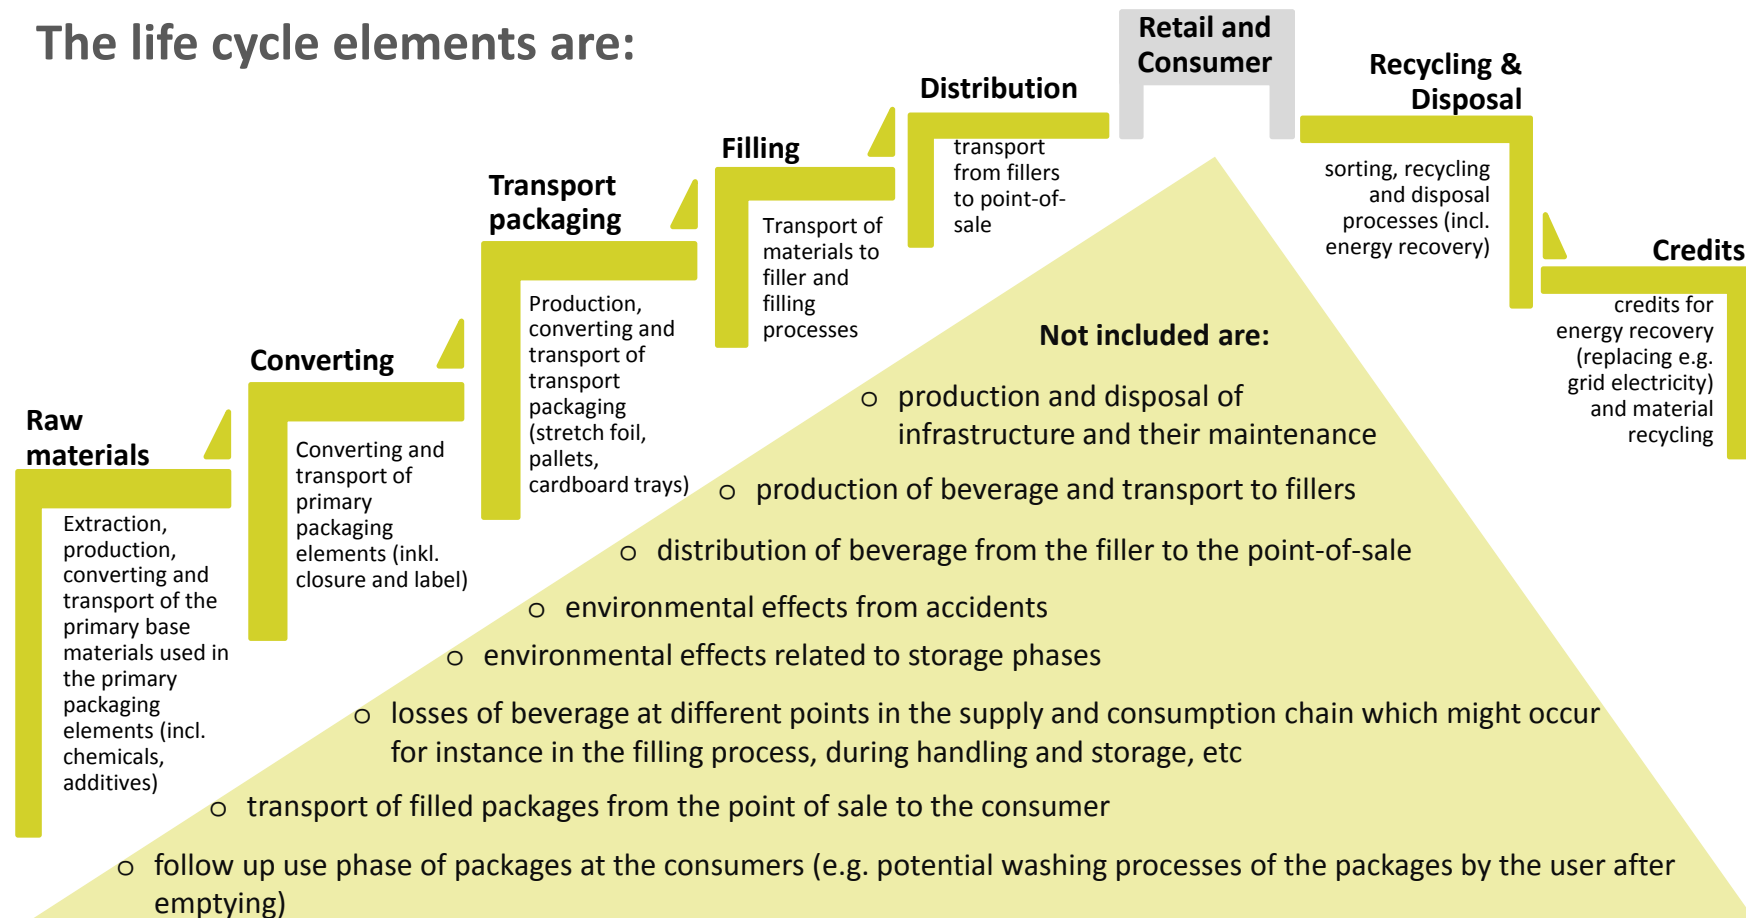

## Time scope

The reference time period for the comparison of packaging systems is 2016. Where no figures are available for these years, the used data shall be as up-to-date as possible.

# System boundaries

The study is designed as a 'cradle-to-grave' LCA.

The life cycle elements are:

# Life cycle elements: beverage cartons

The study is designed as a 'cradle-to-grave' LCA.

The life cycle elements are:

# Life cycle elements: PET/glass bottle and alu can

The study is designed as a 'cradle-to-grave' LCA.

The life cycle elements are:

## Key assumptions: end-of-life routes

| End-of-life routes                                  | Beverage cartons | PET bottles | Glass bottles | Aluminium can | Comments/Source   |
|---|------------------|-------------|---------------|---------------|---|
| Recycling rate                                      | 47.2 % (1)       | 54.8 % (1)  | 71% (2)       | 40.6 % (1)    | (1) mass recycled material per mass on the French market in 2015 / [EcoEmballage 2016]<br><br>(2) 73% collection rate [FEVE 2015] |
| Recycling split                                     |                  |             |               |               |   |
| - fibre recycling/rejects to cement kiln            | 37.5 %           |             |               |               | provided by Tetra Pak   |
| - fibre recycling/rejects to pyrolysis              | 25.0 %           |             |               |               |   |
| - fibre recycling/rejects to agglomeration          | 21.9 %           |             |               |               |   |
| - fibre recycling/rejects to incineration/landfill  | 15.6 %           |             |               |               |   |
| - transparent PET/Glass bottles: material recycling |                  | 100 %       | 100 %         |               |   |
| - aluminium material recycling                      |                  |             |               | 29 %          | [EcoEmballage 2015]   |
| - aluminium bottom ash recovery                     |                  |             |               | 71 %          |   |
| Disposal split                                      |                  |             |               |               |   |
| - to incineration with energy recovery              | 55.8 %           |             |               |               | [EuroStat 2016]   |
| - to incineration without energy recovery           | 1.8 %            |             |               |               | reference year: 2014  |
| - to landfill                                       | 42.4 %           |             |               |               |   |

# Allocation and transport distances

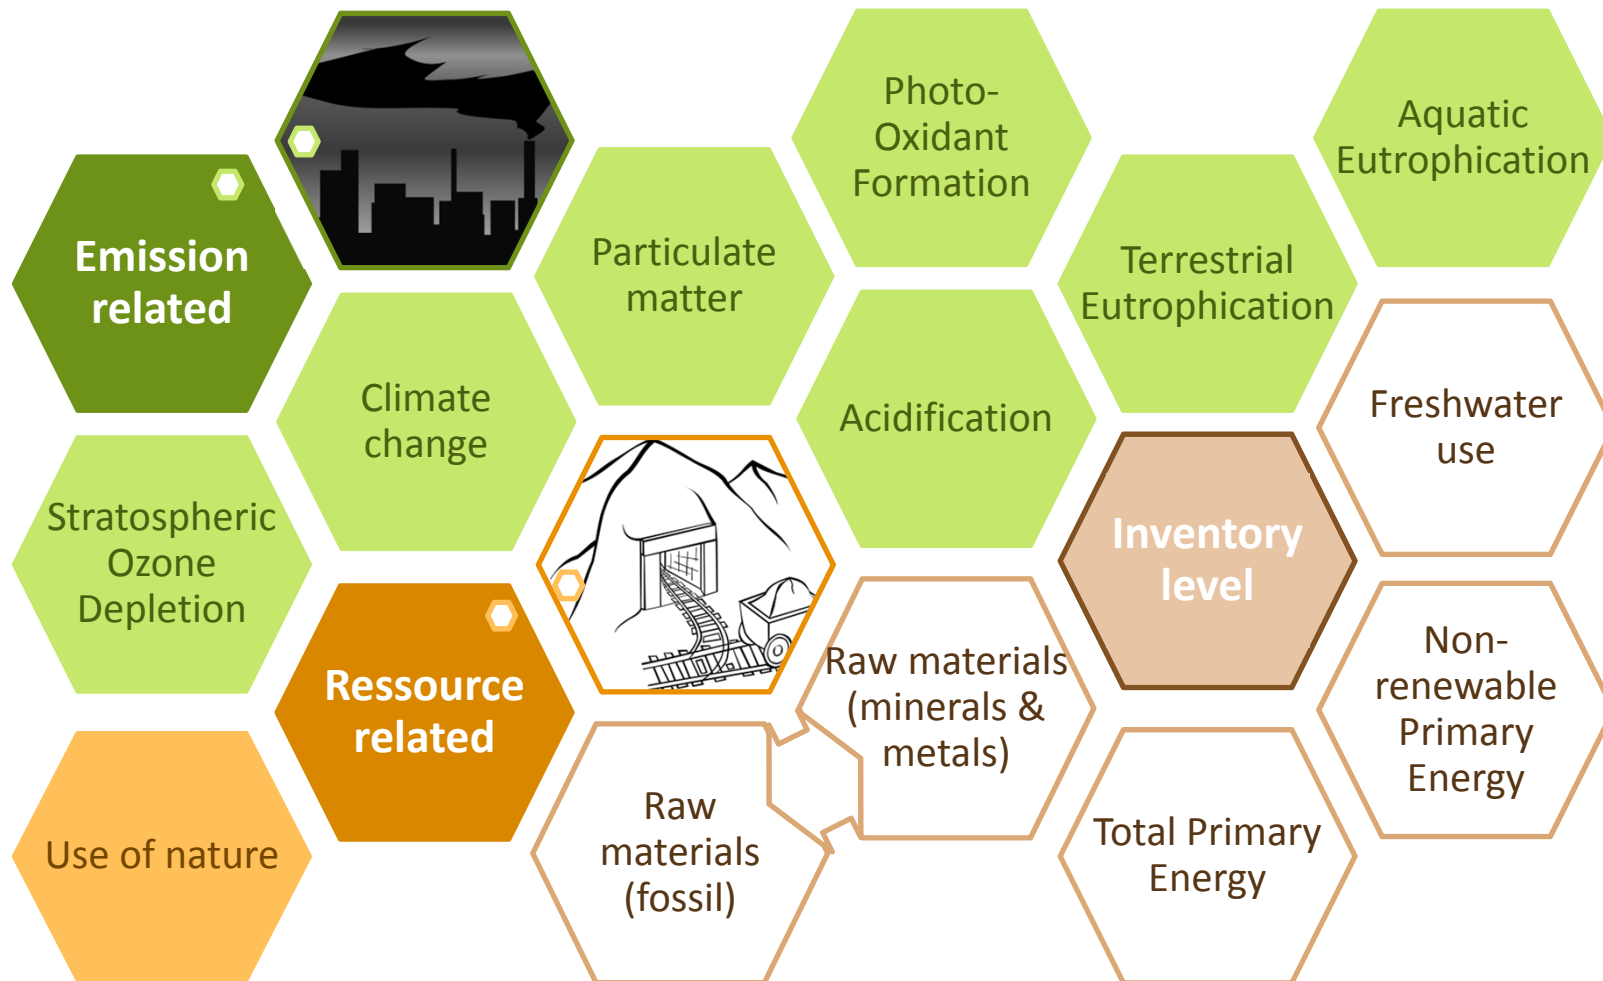

## System allocation

- In the base scenarios a 50% allocation approach is used

## Transport distances (Filling site: Malaga, Spain)

|               | Indirect distribution: distances [km] |               |                            |               | Direct distribution: distances [km] |               |
|---------------|---------------------------------------|---------------|----------------------------|---------------|-------------------------------------|---------------|
|               | Filler to warehouse                   |               | Warehouse to point of sale |               | Filler to point of sale             |               |
|               | Delivery                              | (Return trip) | Delivery                   | (Return trip) | Delivery                            | (Return trip) |
| vegetable oil | 95 % indirect distribution            |               |                            |               | 5 % direct distribution             |               |
|               | 1300                                  | 363           | 200                        | 67            | 1500                                | 495           |
